Chapter 7 Electronic Configurations and the Properties of Atoms - 3 - In this text, we will arbitrarily assign $m_s = +\frac{1}{2}$ to electrons represented with an upward arrow (also called "spin up" electrons) and $m_s = -\frac{1}{2}$ to electrons represented with a downward arrow (also called "spin down" electrons).

A covalent bond, also called a molecular bond, is a chemical bond that involves the sharing of electron pairs between atoms. These electron pairs are known as shared pairs or bonding pairs, and the stable balance of attractive and repulsive forces between atoms, when they share electrons, is known as covalent bonding. [better source needed] For many molecules, the sharing of electrons allows ...

Electron capture (K-electron capture, also K-capture, or L-electron capture, L-capture) is a process in which the proton-rich nucleus of an electrically neutral atom absorbs an inner atomic electron, usually from the K or L electron shell. This process thereby changes a nuclear proton to a neutron and simultaneously causes the emission of an electron neutrino.
